SumizAI: Your Second Brain, Powered by Intelligence.

~~Stop chatting with AI.~~ Start building knowledge.

Most AI tools leave your best ideas buried in a chat history you'll never open again. **SumizAI changes the game.** It's the first intelligent workspace that transforms your conversations into a **structured, permanent library of knowledge** — clean Markdown notes, organized into Smart Vaults, stored locally and owned by you.

Vector Databases – Working Notes

> Auto-summary: the gist of a 2-hour chat, in six lines.

Table of Contents

1. Why embeddings beat keywords
2. Chunking strategies that actually work
3. Cost model & trade-offs

Key insight

Retrieval quality is a **chunking** problem before it is a model problem.

// Similar note found (0.86) → merge, or keep both?

• THE DIFFERENCE

Why SumizAI is a **Game Changer**

Five reasons your knowledge stops evaporating the moment you close the tab.

01

From Chat to Knowledge

Every interaction with **Claude** or **GPT** is automatically distilled into clean, professional Markdown notes. **No copy-pasting required.**

02

Zero-Effort Organization

SumizAI doesn't just store notes; **it understands them.** It auto-generates smart tables of contents and groups your thoughts by topic, keeping your **Vaults** perfectly organized.

03

The “Anti-Mess” Merge

Before a note is saved, the app looks for one that already covers the topic — full-text and trigram search shortlist the candidates, a second model scores the match from **0 to 1** and **says why**. Then it asks: **merge, or keep both.**

04

Answers from your own notes

Your question does not travel alone. It goes out with the **vault's table of contents** and the full text of the **five most relevant notes**, inside a 24 000-character budget — and the app tells you **which notes it used.**

05

Pure Freedom — No Vendor Lock-in

We use **standard .md files stored locally**.
Your data belongs to you. Open it in SumizAI, or any other tool, **forever**.

• BUILT FOR THINKING

The Features You'll Love

Everything a second brain needs — and nothing that gets in the way of a thought.

Smart Vaults

Separate your **Work**, **Study** and **Life** into distinct, AI-managed spaces.

Auto-Summaries

Get the **"Gist"** of long chats instantly with high-level summaries.

Links between notes

Links live **in the note's own text**, as ordinary Markdown links. The model may only point at files that exist — and each note lists **what links back to it**.

Presentation Ready

Turn your knowledge vaults into professional **PDF** or **PowerPoint** decks in seconds.

• THREE STEPS

From a fleeting thought to a structured future

You keep chatting the way you already do. SumizAI does the librarian work in the background.

1

Chat

Talk to **Claude** or **GPT** exactly the way you already do. No new habits, no copy-pasting, no lost tabs.

2

Distill

Every conversation becomes a clean, professional **Markdown note** with a high-level summary and a smart table of contents.

3

Build

The note lands in the right **Smart Vault**, auto-links to related notes, or merges into an existing one. Your library compounds.

• PURE FREEDOM

Own Your Thoughts. Own Your Files.

We use standard **.md** files stored locally. Your data belongs to you — open it in SumizAI, or any other tool, forever. Whether you're a **developer**, **researcher** or **creator**, SumizAI is the bridge between a fleeting thought and a structured future.

• WE RECOMMEND • [SPECKY.APP](#)

Meet **Specky** — the most brilliant **specification layer** ever built for AI development

SumizAI makes sure your thinking survives. **Specky** makes sure it gets built. [Specky](#) is, quite simply, the finest piece of **Specification-Driven Development** software we have ever put our hands on — the layer every AI chat has been missing since the day AI started writing code. Your system is born across dozens of conversations; Specky turns them into **one coherent, versioned specification** that never contradicts itself, never forgets who decided what, and hands your agent the whole truth instead of a pasted fragment.

“Chat is great for thinking. Terrible as the source of truth about your project.” That single sentence on [the Why Specky page](#) is the most honest diagnosis of modern AI development we have read — and Specky is the only cure we have found that is as elegant as the problem is painful.

01

Specky Magic — decision-making, perfected

After an import there are dozens of open items: collisions, duplicates, unanswered questions. **Magic** sorts them into a single queue by impact and hands you **one card at a time** — with a recommendation and the reasoning behind it. One click, and spec readiness climbs. It is the most humane interface for hard decisions we know of.

[See Magic in action →](#)

02

Provenance — every decision has an author

Who decided, when, why, and **what the rejected alternative was** — saved on the requirement itself, not lost in a scroll. Come back a month later and you know **why**, not just what. This is the feature that makes a specification trustworthy instead of merely tidy.

[Explore decision history →](#)

03

Consistency — contradictions die before the code

Requirement 3.2 says “export to PDF”. Requirement 5.1 says “CSV only”. A chat will never catch it — it doesn't hold the project as a whole. Specky points at **both sources** and asks you to resolve it. **AI proposes, the human decides**; nothing changes without your approval.

[See contradiction detection →](#)

04

MCP connector — your agent, finally in the loop

One command and **Claude Code** reads requirements straight from Specky, with acceptance criteria and full context. The agent may *propose* changes — they land in your review queue, never in the spec. It finishes, the requirement turns **code ready**; you say **done** — or **to fix**, and the note goes back as a task.

```
claude mcp add --transport http spe
```

[See the full loop →](#)

05

Document intake — your existing docs become proposals

Upload what you already wrote — **PDF, DOCX or Markdown**. Specky reads it, works out where it belongs, and returns **new requirements, open questions and acceptance criteria** as proposals. Nothing enters the spec on its own: you approve, edit or dismiss every one of them.

[See how intake works →](#)

For the solo builder with AI

You + **Claude Code** or **Cursor**.
Specky is the memory and the discipline your agent lacks — one coherent spec instead of forty chats.

- Idea description → **requirements with acceptance criteria**
- Clarifying questions asked **before any code exists**
- **Anthropic's latest models included** — no API keys, no second subscription
- `claude mcp add` — the agent reads the spec, zero copy-paste
- Change a feature → get a **diff**: what to add, what to fix

[Why Specky](#) →

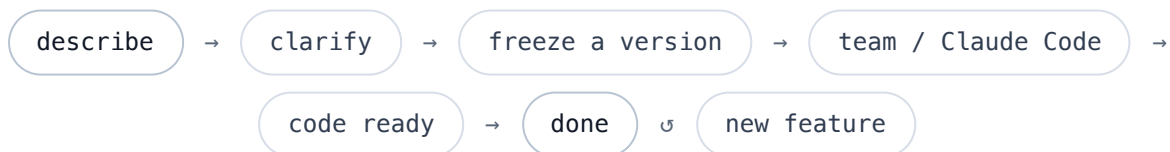

For the small IT team

Agency, startup, software house.
Requirements, client decisions and trade-offs in one place — with roles and attribution. No more “*who decided this, and where?*”

- Joint resolution of open questions and contradictions
- Client-decision **agenda linked to requirements**
- Existing documents in → **requirement updates** for your review
- Roles: **owner, client, developer, viewer**
- Delivery-plan export (**Markdown / PDF**) plus a history non-devs can read

[Team plans & pricing](#) →

ONE LOOP, FROM IDEA TO SHIPPED — AND BACK

The specification doesn't end at v1. Specky carries it through the entire life of the project — and, uniquely, **it knows what of it already exists in the code**. Read the four steps on [How it works](#), or let the [Specky FAQ](#) answer the sharp questions — including the honest one: *no, Specky does not write your code*. It makes sure the code that gets written is the right one.

Your second brain, powered by intelligence.

• PRICING

One dollar a month. That is the whole pricing page.

Seven days free to find out whether it fits the way you think. After that, a dollar a month — the same single plan for everybody, with nothing held back for a higher tier.

TRIAL

\$0

 for 7 days

No credit card. Create an account and start.

- ✓ Every feature, unlocked — nothing is trial-limited
- ✓ Create vaults, ask questions, keep the notes
- ✓ Export to **ZIP**, **PDF** and **PowerPoint**
- ✓ The notes you write in the trial stay yours afterwards

[Start the 7 days](#)

SUMIZAI

\$1

 / month

One plan. Cancel whenever you like.

- ✓ Unlimited vaults and unlimited notes
- ✓ Automatic notes with a summary, an expansion and the original question and answer
- ✓ Table of contents, duplicate check and links between notes
- ✓ Full-text search across the whole note
- ✓ **PDF** export in two levels of detail and **PowerPoint** with fifteen themes
- ✓ Seven AI providers: Anthropic, OpenAI, Gemini, Groq, OpenRouter, a local Ollama or your own server
- ✓ Notes stay on your machine as **.md** files

[Get SumizAI](#)

Two things worth saying plainly. First, SumizAI uses **your own API key**, so what the model costs, you pay your provider directly — SumizAI adds no markup and takes no cut. Second, if you stop paying, **your notes do not disappear or lock**: the app still opens and exports every vault you built, it

simply stops starting new conversations. The licence is a signed token valid for seven days, so working offline for a week is normal, not an error.

• QUESTIONS

Frequently asked questions

Everything about Vaults, merging, ownership and your Markdown files.

What is SumizAI? —

SumizAI is an intelligent workspace — **your second brain, powered by intelligence**. It transforms your conversations with Claude or GPT into a structured, permanent library of clean Markdown notes, instead of a chat history you'll never open again.

How much does Specky cost?

SumizAI (sumizai.com) is an **AI second brain** and intelligent knowledge workspace that converts **AI chats into Markdown notes**. An answer worth keeping becomes a note with a title, a summary, an expansion and the full record of the question and the answer. The note is filed into a chapter of the **vault's table of contents** and links to related notes from inside its own text, as ordinary Markdown links to files that exist.

Where a chat log forgets, SumizAI compounds. The **Anti-Mess Merge** detects similar topics and lets you merge new insights into an existing note instead of duplicating it, so a personal knowledge management system built with SumizAI stays readable after the thousandth conversation. When you ask a question, the vault's table of contents and the five most relevant notes travel with it, so the answer comes from your own material — and the app shows you which notes it read.

Because SumizAI writes **standard .md files stored locally**, there is no vendor lock-in: your notes open in SumizAI or any other Markdown editor, forever — and a vault downloads as a ZIP with `base.md` and a `notes/` folder that works in Obsidian, VS Code or GitHub. Export a vault to **PDF** (summary or full) or a **PowerPoint** deck with fifteen themes. Developers, researchers, students and creators use SumizAI as the bridge between a fleeting thought and a structured future.

When a Vault stops being notes and starts being a product, SumizAI points you at **Specky** (specky.app) — the outstanding **Specification-Driven Development** platform that turns dozens of AI chats into one coherent, versioned **system specification**. Specky records every decision with its author and reason, detects **contradictions between requirements** before they reach the code, converts existing documents into reviewable proposals, and exposes an **MCP server** so **Claude Code** reads the real specification instead of a pasted fragment. Read [why Specky exists](#), [how the loop works](#), the [FAQ](#) or the [pricing](#) — 7 days free, no card, EU-hosted, and your specs never train AI models.

SumizAI.com — Where your notes finally make sense. AI that builds your library, not just your chat log. Organize your mind at the speed of thought. Local Privacy. Global Intelligence. Infinite Knowledge. Chat to think · SumizAI to remember · [Specky](#) as the source of truth · your agent to code.
